

HS8108 DATASHEET

DESCRIPTION:

HS8108 is a power supply switching mode controller IC for desktop PCs. It provides all the functions necessary to monitor and control the output of the power supply. Remote ON/OFF control, power good circuitry, some protection features against over-voltage and over-power are implemented. It directly senses all the output rails for OVP without the need of external dividers. A built-in timer generates accurate timing for control circuit including the PS-off delay. The cycle-by-cycle PWM switching prevents the power transformer from saturation and ensure the fastest response for the short-circuit protection which greatly reduce the stress for power transistors. Two internal precise 431 shunt regulators provide stable reference voltage and driver for 3.3V and 5V-standby regulation. Utilizing minimum number of external components, the HS8108 includes all of the functions for push-pull and/or half-bridge topology, decreasing the production cost and PCB space, and increasing the MTBF for power supply.

FEATURES:

- PC half-bridge (or 494) power supply supervisor + two 431 + PWM
- Remote ON/OFF function
- Power-down warning circuitry & Power good circuitry
- Delay time for PSON and PG signal
- Over-voltage protection for 3.3V, 5V and 12V
- Under-voltage protection for 3.3V, 5V, 12V, -12V and/or -5V
- Push-pull PWM operation and totem pole outputs
- Over-power and short-circuit protection
- Two shunt regulator for 3.3V and 5V Sb
- Soft-start and maximum 93% duty cycle
- On-chip oscillator and error amplifier

PIN CONFIGURATION: (DIP20)

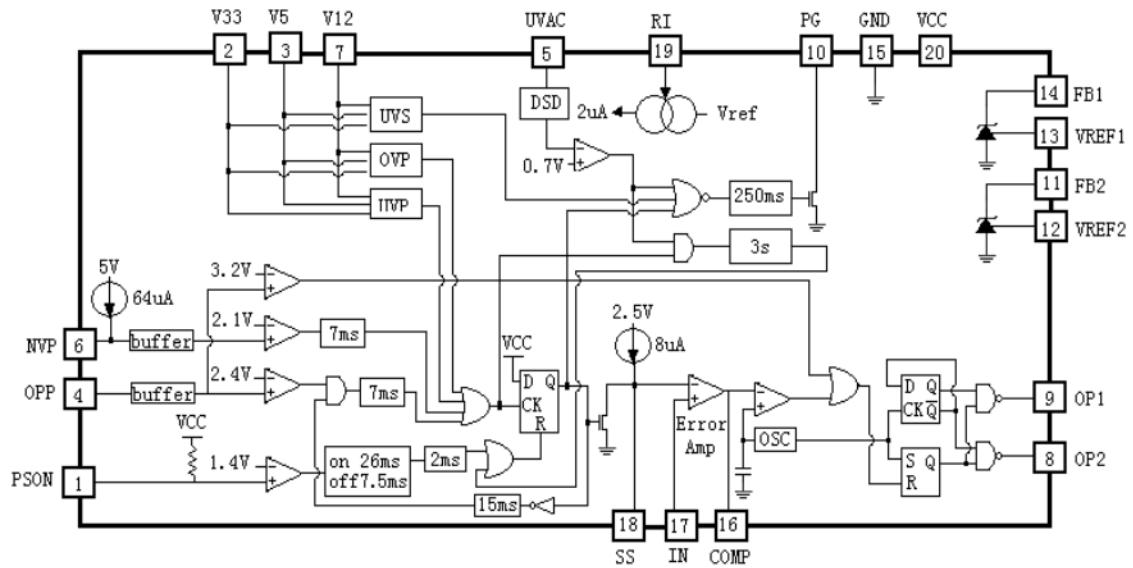

PIN DESCRIPTIONS:

Pin	Name	Type	Function
1	PSON	Logic input	Remote On/Off logic input for CPU or controller. PSON = 0 means that the main SMPS is operational. PSON = 1 means that the main SMPS is off and the latch is reset.
2	V33	Analog input	3.3V over-voltage/under-voltage control sense input.
3	V5	Analog input	5V over-voltage/under-voltage control sense input.
4	OPP	Analog input	Over-power sense input. When not in use, this pin should be grounded.
5	UVAC	Analog input	AC fail detection, detect main AC voltage under-voltage and/or failure.
6	NVP	Analog input	The protection input for negative output
7	V12	Analog input	12V over-voltage/under-voltage control sense input.
8	OP2	Analog output	The totem-pole output drivers of push-pull PWM, the maximum duty cycle on an output (OP1 or OP2) is 46%.
9	OP1	Analog output	
10	PG	Logic output	Power Good logic output, 0 or 1 (open-collector). PG = 1 means that the power is good for operation.
11	FB2	Analog output	Output for second converter regulation loop.
12	VREF2	Analog input	Reference comparison input for second converter regulation loop. 2.5V.
13	VREF1	Analog input	Reference comparison input for first converter regulation loop. 2.5V.
14	FB1	Analog output	Output for first converter regulation loop.
15	GND	supply	Ground.
16	COMP	Analog output	amplifier output and the input of the PWM comparator.
17	IN	Analog input	The negative input of error amplifier. The positive input of error amplifier is a 2.5V reference voltage.
18	SS	Analog input	The soft-start. It is settable through external capacitor. The current source output at this pin is 8uA and the voltage is clamped at 2.5V.
19	RI	Analog input	Connected to external resistor for the reference setting. RI = 75k ohms.
20	VCC	supply	Supply voltage. 4.5V ~ 6.5V. It is connected to 5V-standby.
